

SWAP

The GitHub URL-Swap Cheat Sheet

13 ways to give any repo a superpower — without installing, cloning, or typing a single command. You just change the domain in the URL. Learn the move once; it works on every repo on GitHub.

```
https:// gitingest.com /owner/repo
```

Change the **domain**. Keep the **/owner/repo**. Get a superpower.

~~github.com~~ → [swap this]/karpathy/nanoGPT

Every GitHub link is `github.com / owner / repo`. A whole ecosystem of tools copied that exact path shape — so you leave the **/owner/repo** where it is and just change the domain. You're not learning 13 tools. You're learning **one move, 13 times**. The examples below all use `karpathy/nanoGPT` — swap in any repo you like.

READ & EDIT — instant VS Code

press `.`

Opens the repo in a full VS Code editor in your browser.

Best for: Quick poke-around, search across files.

TRY On any repo page, tap the period key.

`github.dev`

Same VS Code editor, as a shareable URL.

Best for: Linking someone straight into the code.

TRY `github.dev/karpathy/nanoGPT`

`github1s.com`

VS Code view, classic flavor.

Best for: Reading an unfamiliar codebase fast.

TRY `github1s.com/karpathy/nanoGPT`

FEED IT TO AI — the payoff

`gitingest.com`

Flattens the **WHOLE** repo into one prompt-friendly text + token count.

Best for: Asking an AI about a whole codebase. One copy, one paste.

TRY `gitingest.com/karpathy/nanoGPT`

`gitingest (CLI)`

Same flatten, from your terminal — pipe a repo straight into a prompt.

Best for: Terminal-first workflows, scripting.

TRY `pipx run gitingest` (or `pip install gitingest`)

`gitmcp.io`

Turns the repo into a live MCP server your AI can query in real time.

Best for: Stopping AI from inventing functions that don't exist.

TRY Paste `gitmcp.io/karpathy/nanoGPT` into your editor's MCP settings.

MORE SWAPS

Same move. Different **superpower**.

UNDERSTAND IT — in plain English

git**diagram**.com

Reads the repo and draws an interactive architecture diagram. Click a box → jump to that folder.

Best for: Getting oriented in a brand-new repo.

TRY gitdiagram.com/karpathy/nanoGPT

deep**wiki**.com

Auto-generates a Wikipedia-style wiki + an Ask box that answers questions and cites files.

Best for: Understanding without reading code.

TRY deepwiki.com/karpathy/nanoGPT

github.**gg**

A control panel for the repo: one-click copy-for-AI, security scan, quality score, diagrams.

Best for: Repo intelligence at a glance.

TRY github.gg/karpathy/nanoGPT

RUN IT — zero setup

stack**blitz**.com

Boots the project in a real, working dev environment in your browser.

Best for: Running a repo without cloning or installing.

TRY stackblitz.com/github/karpathy/nanoGPT

bolt.**new**

Imports the entire repo into an AI builder, agent standing by to edit & ship.

Best for: Editing a repo with an AI, instantly.

TRY bolt.new/github.com/karpathy/nanoGPT

READ THE SIGNAL

star-**history**.com

Charts the repo's stars over time. Steady climb = healthy; flat/cliff = careful.

Best for: A lie-detector for open-source momentum.

TRY star-history.com → paste karpathy/nanoGPT

git**podcast**.com

Turns a repo into an audio podcast — two hosts explaining the project.

Best for: Understanding by listening. (And it's wild.)

TRY gitpodcast.com/karpathy/nanoGPT

Don't memorize 13. Burn the **top three** into muscle memory.

S

Use it **THIS** week

`press . · gitingest · gitmcp`

A

When you're lost in a codebase

`deepwiki · gitdiagram`

B

Handy now and then

`github1s / github.dev · github.gg · stackblitz · bolt.new · star-history`

F

Try once, grin, share

`gitpodcast`

! THE CATCH (read before you swap)

- **Most are third-party tools, public repos only.** Never paste private code, secrets, or API keys into a random site to feed an AI.
- **Tools come and go.** The mechanic — swapping the domain — is forever. Any single tool, no guarantees.

✓ **Safe for private/sensitive work:** the first-party moves — the **period key** and **github.dev** — are just GitHub's own editor. Nothing leaves their walls.

GO DEEPER

Now go make your **first swap**.

Grab any repo you're curious about, change `github.com` to `gitingest.com`, and watch the whole thing turn into one message you can paste into any AI. That's the whole idea — every other swap is a variation on it.

Want this sheet + new AI moves every day?
